

MEMOLUB[®] Solutions

CASE STUDY 405

Application : Crusher

Industry : Quarry

Problems : Irregular and infrequent manual lubrication lead to costly component failures. In addition, production had to stop while components were manually lubricated.

Solution : Ten Model 480 MEMOLUB lubricators were mounted on the outside of the crusher, and lines were run to the lube points. Difficult-to-reach points were now being lubricated remotely from a safe location, and without the need for shutting down production.

It is always desirable to mount your lubrication system indoors, where it is protected from the elements. However, when this just isn't possible, as in this quarry application, it's good to know that the resilient design of the MEMOLUB makes it ideal for outdoor applications as well. Cold or hot temperatures. Dirty and wet environments. The MEMOLUB[®] is tough enough to handle even the harshest environments, including quarries, steel mills, pulp and paper mills, and power plants.
